SUMMARY: *Choriopetes texanus* and *Dermatophilus congoensis* were diagnosed from skin scrapings in a dairy cattle herd from the State of Minas Gerais with desquamation, crusts and matted hair. Lesions were seen in the root of the tail and around hocks of the feet in stabled cows and heifers but not calves.

KEY WORDS: *Choriopetes texanus*, *Dermatophilus congoensis*, Acari, mange, cattle.
